Target Information

Protein Name	Nuclear factor erythroid-2-related factor-2
Gene Name	*NFE2L2*
Domain	NA
Background	Nrf2 (NFE2-like bZIP transcription factor 2) is bZIP leucine-zipper transcription-factor family protein acting as master regulator of cellular antioxidant and phase-II detoxification response. Under basal conditions Nrf2 interacts with KEAP1 for continuous ubiquitination and degradation. Oxidative or electrophilic stress modifies KEAP1, enabling Nrf2 stabilization and nuclear import. Nrf2 heterodimerizes with small Maf proteins, binds antioxidant-response-element (ARE) and up-regulates cytoprotective genes such as HO-1 and NQO1 to counteract ROS and xenobiotic injury. Dysregulated Nrf2 signaling links to inflammation, neurodegeneration and cancer; constitutive Nrf2 stabilization confers chemoresistance in malignancies. Nucleo-cytoplasmic partitioning of Nrf2 indicates pathway activation status.
